## Treat Nail Fungus with LASER!

### Treating Nail Fungus has Never Been Easier.

In the past, the treatment of nail infection has been difficult because the infection is under and inside of the nail. This makes it hard for any treatment to reach and destroy the infection.

Now there is better option. Laser light therapy targeting the fungi responsible for the infection, while leaving the nail and surrounding healthy tissue intact.

The laser procedure takes about 30 minutes. There is no recovery period; just walk in and walk out.

Ask your doctor if laser therapy is the right treatment for you.

### Targeted Areas for Dramatic Results

The laser light passes through the nail without causing damage to the nail or the surrounding skin. At the time of the procedure, the nail will not become instantly clear, it takes time to grow out. However, you may apply polish immediately after the treatment.

### Powerful, Yet Pain Free

Perhaps the most welcomed advantage is most people feel no pain. Some people feel a warming sensation and very few feel a pinprick.

### Results After One Treatment

One treatment kills the fungus for most patients. The infection improves following one treatment and typically your physician will recommend care techniques to reduce recurrence of the infection. Your provider will determine your full treatment plan.
